

ABSTRACT

A touch-control floor lamp includes a hollow supporting post extended from a seat, and a secondary light base and a main light base at an upper end of the supporting post. The invention is characterized that, 5 the secondary light base and the main light base are both controlled by a touch-control switch and an integrated circuit. According to the aforesaid structure, the secondary light and the main light can be switched on or off in sequence by touching the supporting post, thereby individually or simultaneously illuminating the second light and the main 10 light and facilitating brightness adjustment.
